

Surface and groundwater

Current research projects are looking at maximising the amount of treated coal seam gas water that can be re injected into aquifers.

Agricultural land management

Current research projects are designed to maximise agricultural productivity during and beyond the life of gas extraction on farms.

Socio-economic

Current research projects are identifying what communities want and need to help inform and support changes occurring in coal seam gas development regions.

Health impact

Current research projects are focusing on reviewing current information to look for potential health impacts of coal seam gas.

Greenhouse gas footprint

Current research project is looking at characterising methane emissions from the Surat Basin.

Terrestrial biodiversity

Current research projects are identifying cost effective actions that can be taken to reduce threats to plants and animals.

Marine environment

Current research projects are examining how sediments from dredging and discharge affect seagrass and turtle feeding grounds.
